Alkeran tablets

What is melphalan?

Melphalan is a cancer medication that interferes with the growth and spread of cancer cells in the body.

Melphalan is used to treat multiple myeloma (a type of blood cancer) and cancer of the ovary.

Melphalan treats only the symptoms of ovarian cancer or multiple myeloma, but does not treat the cancer itself.

Important Information

Melphalan can lower blood cells that help your body fight infections and help your blood to clot. You may get an infection or bleed more easily. Call your doctor if you have unusual bruising or bleeding, or signs of infection (fever, chills, body aches).

Before taking this medicine

You should not use melphalan if you are allergic to it, or if prior treatment with this medication was unsuccessful in controlling your disease.

To make sure melphalan is safe for you, tell your doctor if you have:

- a weak immune system (caused by disease or by using certain medicine);
- liver disease;
- kidney disease; or
- a history of chemotherapy or radiation.

Using melphalan may increase your risk of developing other types of cancer, such as leukemia. Ask your doctor about your specific risk.

Do not use melphalan if you are pregnant. It could harm the unborn baby. Use effective birth control to avoid pregnancy during your treatment with melphalan. Follow your doctor's instructions about how long to prevent pregnancy after your treatment ends.

This medication may affect fertility (your ability to have children), whether you are a man or a woman.

It is not known whether melphalan passes into breast milk or if it could harm a nursing baby. You should not breast-feed while using melphalan.

How is melphalan given?

Follow all directions on your prescription label. Your doctor may occasionally change
